Full-Stack Assessment Task: EdTech CRM & Inquiry System

1. Objective
Build a simple and clean full-stack CRM inquiry system where anyone can submit a public inquiry form with category and user-type filters, and an admin can log in to view and manage all inquiries.

2. Tech Stack & Architecture
Frontend: React.js / Next.js / HTML-CSS-JS (Any framework)
Backend: Node.js (Express) or Python / Java (Standard backend structure)
Database: Supabase (PostgreSQL) — Candidates must use Supabase as the database provider via standard connection strings (pg, Prisma, or Sequelize).

3. Core Features to Implement-

A. Public Inquiry Form:
A clean, responsive form with the following fields:
User Type (Dropdown): Parent / Student / School
Category (Dropdown): Scholarship / Concert / Admission / General Query
Personal Details: Name, Email, Phone Number
Message / Query: Text area
Submitting the form must save the data directly into the Supabase PostgreSQL database.

B. Admin Authentication & Dashboard:
Secure Admin Login using custom JWT-based authentication implemented in the backend.
Note:[Candidate must implement custom JWT-based authentication from scratch in their backend (password hashing using bcrypt, JWT generation, and protected routes middleware. Using Supabase Auth is not allowed for this assessment]
Protected dashboard route accessible only to authenticated admins.
A tabular view showing all submitted inquiries with details (Name, Phone, Email, User Type, Category, Date, and Status).

C. Filters & Search (Mandatory):
Admin dashboard must include filters:
Filter by Category (Scholarship, Concert, Admission, general query)
Filter by User Type (Parent, Student, School)
Search bar for Name or Phone number.

4. Deliverables for Candidates-

GitHub Repository Link: Clean code containing both frontend and backend directories.

Database Schema & SQL Script (schema.sql): SQL file containing table creation queries for tables like inquiries and admins.

Environment Sample File (.env.example): A template showing required environment variables, including the Supabase database connection string/URL so the evaluator can connect.

README.md: Clear setup instructions (how to run locally, environment variables setup, and how to test the custom JWT auth).
Live Demo Link : Deployed URL via Vercel, Render, or Netlify.
